

## FIRES & ACCESSORIES.

Your fireplace purchase is an investment in not only your home but also your lifestyle. Unique Fires and Accessories is a supplier of most leading brands. Whether it is a wood, gas or outdoor pizza oven for the alfresco area, hearth, mantel, fireplace tools, repair products and all accessories, Unique Fires and Accessories is a one-stop shop for your fireplace solutions.

### Comfort for your home

There is nothing like the feeling of warmth and well-being you will experience from the glow of a wood or gas fire in your home.

#### Wood Fires

Today's woodfires use less fuel, burn cleaner, are easier to clean, and can provide whole house heating without fuss or mess.

Modern controlled combustion (clean burning) wood heaters are up to 80 per cent more efficient than older wood heaters and open brick

fires. This means less fuel and less cost for a lot more heat.

#### Gas Fires

Open style gas fireplaces have plenty of ambience but lower heat output. If you're after more warmth and efficiency from your gas fire choose a sealed unit. With such a variety of features to choose from, contact us for expert advice so you get the desired result you are after.

It's easy to be warm and dry with your new wood or gas heater.

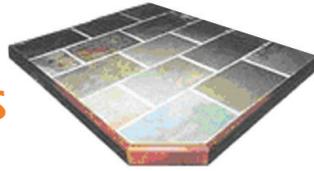

Our brands of fires include: Kemlan, Nectre, Masport, Logaire, Saxon,

Jotul, Arrow, Coonara, Heat Charm, Morso, Kent, Scandia, Metro, Cannon, Stanley Cookers, and Rayburn Cookers.

We have a huge selection of wood and gas fires, with freestanding or inbuilt options. We also supply accessories including hearths, flue kits, decros, fire tools and repair products. Installation can be arranged for you.

**Add character, warmth, luxury and class to your home.**

## FIRES & ACCESSORIES

Wood heaters are available in a wide range of models from small units for single room heating, to large units with the capacity to heat relatively large houses. The final selection will depend upon factors such as house design, insulation levels and the length of time the heater will be operated.

### Convection Fires

A convection fire has a casing around the fire box allowing the air to flow. As the air passes the fire box, it is heated.

Convection fires provide a more even heat to the room. The air is warmed from the ceiling down. It operates in a cycle where it heats the air surrounding the ceiling area first and then pushing the warm air down.

A convection fire is more suitable for a room or house with standard ceiling height and where more even heat distribution is desired.

### Radiant Fires

Radiant fires heat quickly and if you sit close to them you can get warm even if the whole room has not had time to warm up

A radiant fire transfers about two thirds of its heat by radiation and one third by convection. A radiant fire is more suitable for rooms with high ceilings.
